**Abstract:** - The concept of bitopological space was first introduced by J.C.Kelly in 1963 (i.e) a non empty set  $X$  equipped with two arbitrary topologies  $\tau_1$  and  $\tau_2$ .The concept of generalized closed sets plays a significant role in general topology and these are the research topics of many Topologists worldwide.In 1970 Norman Levine introduced the concept of generalization of closed sets in topological spaces and he defined the semi-open sets and semi-continuity in bitopological spaces.The concept of continuity in topological spaces was extended to bitopological spaces by Pervin (1967).we have already introduced  $(i,j)$ - $g^{##}$  closed sets (i.e)a subset  $A$  of a bitopological space  $(X,\tau_1,\tau_2)$  is called  $(i,j)$ - $g^{##}$ -closed if  $\tau_j\text{-cl}(A) \subseteq U$ , whenever  $A \subseteq U$ ,  $U$  is  $\tau_i$ - $g^{##}$ -open in  $(X,\tau_1, \tau_2)$  and some of the properties were discussed. In this paper we introduce  $(i,j)$ - $g^{##}$  continuous functions in bitopological spaces and discuss the relation with other continuous functions and obtained their characteristics

## Keywords

Bitopological space,  $(i,j)$ - $g^{##}$  closed set,  $(i,j)$ - $g^{##}$  continuous map.

AMS Mathematics Subject Classification 2010:54A05,54A10

## I. INTRODUCTION

A triple  $(X, \tau_1, \tau_2)$  where  $X$  is a non-empty set  $\tau_1$  and  $\tau_2$  are topologies on  $X$  is called a bitopological space and Kelly[7] initiated the study of such spaces.In 1985,Fukutake[4] introduced the concepts of  $g$ -closed sets in bitopological spaces.In this paper we introduce new type of continuous map called  $(i,j)$ - $g^{##}$  continuous map by applying  $(i,j)$ - $g^{##}$  closed sets[12] in bitopological spaces and investigated their properties.

## II. PRELIMINARIES

**Definition 2.1** A subset  $A$  of a topological space  $(X, \tau)$  is called

1. regular-open set[10] if  $A = \text{int}(\text{cl}(A))$
2. generalized closed set[8]( $g$ -closed) if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
3. generalized star closed set[16 ](briefly  $g^*$ -closed) if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  is  $g$ -open in  $(X, \tau)$ .
4.  $g^\#$ -closed set[18] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha g$ -open in  $(X, \tau)$ .
5.  $\alpha$ -closed[9] if  $\text{cl}(\text{int}(\text{cl}(A))) \subseteq A$
6. a  $\alpha$ -generalized closed[2] (briefly  $\alpha g$ -closed) if  $\alpha \text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
7.  $g^*p$ -closed[17] if  $p\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g$ -open in  $(X, \tau)$ .

**Definition 2.2** A subset  $A$  of a bitopological space  $(X, \tau_i, \tau_j)$  is called

1. a  $(i,j)$ - $g$ -closed[4] if  $\tau_j\text{-cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $\tau_i$ .
2. a  $(i,j)$ - $g^*$ -closed[14] if  $\tau_j\text{-cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g$ -open in  $\tau_i$ .
3. a  $(i,j)$ - $gs$ -closed[15] if  $\tau_j\text{-scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $\tau_i$ .
4. a  $(i,j)$ - $gsp$ -closed[3] if  $\tau_j\text{-spcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $\tau_i$ .
5. a  $(i,j)$ - $gpr$ -closed[6] if  $\tau_j\text{-pcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $r$ -open in  $\tau_i$
6. a  $(i,j)$ - $(g^*p)^*$ -closed[17]  $\tau_j\text{-cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g^*p$ -open in  $\tau_i$ .
7. a  $(i,j)$ - $g^\#$ -closed[16]  $\tau_j\text{-cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\alpha g$ -open in  $\tau_i$ .
8. a  $(i,j)$ - $g^{**}$ -closed[11] if  $\tau_j\text{-cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g^*$ -open in  $\tau_i$ .
9. a  $(i,j)$ - $g^{##}$ -closed[12] if  $\tau_j\text{-cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g^\#$ -open in  $\tau_i$ .
10. a  $(i,j)$ - $wg$ -closed[5] if  $\tau_j\text{-cl}(\text{int}(A)) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $\tau_i$ .
11. a  $(i,j)$ - $rg$ -closed[1] if  $\tau_j\text{-cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $r$ -open in  $\tau_i$ .
12. a  $(i,j)$ - $\alpha g$ -closed[13] if  $\tau_j\text{-cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $\tau_i$ .

**Definition 2.3** A function  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  is called

1.  $(i, j)$ - $g$ -continuous[4] if  $f^{-1}(V)$  is a  $(i, j)$ - $g$ -closed in  $(X, \tau_1, \tau_2)$  for every closed set  $V$  of  $(Y, \sigma_1, \sigma_2)$ .
2.  $(i, j)$ - $g^\#$ -continuous[17] if  $f^{-1}(V)$  is a  $(i, j)$ - $g^\#$ -closed in  $(X, \tau_1, \tau_2)$  for every closed set  $V$  of  $(Y, \sigma_1, \sigma_2)$ .
3.  $(i, j)$ - $gsp$ -continuous[3] if  $f^{-1}(V)$  is a  $(i, j)$ - $gsp$ -closed in  $(X, \tau_1, \tau_2)$  for every closed set  $V$  of  $(Y, \sigma_1, \sigma_2)$ .
4.  $(i, j)$ - $rg$ -continuous[1] if  $f^{-1}(V)$  is a  $(i, j)$ - $rg$ -closed in  $(X, \tau_1, \tau_2)$  for every closed set  $V$  of  $(Y, \sigma_1, \sigma_2)$ .
5.  $(i, j)$ - $wg$ -continuous[5] if  $f^{-1}(V)$  is a  $(i, j)$ - $wg$ -closed in  $(X, \tau_1, \tau_2)$  for every closed set  $V$  of  $(Y, \sigma_1, \sigma_2)$ .
6.  $(i, j)$ - $gpr$ -continuous[6] if  $f^{-1}(V)$  is a  $(i, j)$ - $gpr$ -closed in  $(X, \tau_1, \tau_2)$  for every closed set  $V$  of  $(Y, \sigma_1, \sigma_2)$ .
7.  $(i, j)$ - $g^{**}$ -continuous[11] if  $f^{-1}(V)$  is a  $(i, j)$ - $g^{**}$ -closed in  $(X, \tau_1, \tau_2)$  for every closed set  $V$  of  $(Y, \sigma_1, \sigma_2)$ .
8.  $(i, j)$ - $\alpha g$ -continuous[13] if  $f^{-1}(V)$  is a  $(i, j)$ - $\alpha g$ -closed in  $(X, \tau_1, \tau_2)$  for every closed set  $V$  of  $(Y, \sigma_1, \sigma_2)$ .
9.  $(i, j)$ - $((g^*p)^*)$  continuous[17] if  $f^{-1}(V)$  is a  $(i, j)$ - $((g^*p)^*)$ -closed in  $(X, \tau_1, \tau_2)$  for every closed set  $V$  of  $(Y, \sigma_1, \sigma_2)$ .
10.  $\tau_j$ - $\sigma_k$  continuous[14] if  $f^{-1}(V) \in \tau_j$  for every  $V \in \sigma_k$ .

We introduce the following definition:

**Definition 3.1:**

A map  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  from a topological space  $(X, \tau_1, \tau_2)$  to a topological space  $(Y, \sigma_1, \sigma_2)$  is called a  $(i, j)$ - $g^\#$  continuous if the inverse image of every closed set in  $(Y, \sigma_1, \sigma_2)$  in  $(i, j)$ - $g^\#$  closed set in  $(X, \tau_1, \tau_2)$ .

**Proposition 3.2:** Every continuous map is  $(i, j)$ - $g^\#$  continuous.

**Proof :** Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  be a continuous map.

To prove:  $f$  is  $(i, j)$ - $g^\#$  continuous.

Let  $V$  be a closed set in  $(Y, \sigma_1, \sigma_2)$ .

Since  $f$  is continuous,  $f^{-1}(V)$  is closed in  $(X, \tau_1, \tau_2)$ .

Since  $f^{-1}(V)$  is  $(i, j)$ - $g^\#$  closed.

Hence  $f$  is  $(i, j)$ - $g^\#$  continuous.

**Remark 3.3** Converse of the above proposition is not true in general as seen from the following example.

**Example 3.4:** Let  $X = \{a, b, c\}$

$\tau_1 = \{\emptyset, X, \{a\}, \{a, b\}\}, \tau_2 = \{\emptyset, X, \{a\}, \{b, c\}\}$

And let  $Y = \{p, q\}$   $\sigma_1 = \{\emptyset, Y, \{p\}\}, \sigma_2 = \{\emptyset, Y, \{q\}\}$

Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  be defined by  $f(b) = f(c) = \{p\}$  and  $f(a) = \{q\}$

To prove :  $f$  is  $(i, j)$ - $g^\#$  continuous but not continuous.

$f^{-1}(p) = \{b, c\}$  and  $f^{-1}(q) = \{a\}$  are  $(i, j)$ - $g^\#$  closed in  $(X, \tau_1, \tau_2)$

Therefore  $f$  is  $(i, j)$ - $g^\#$  continuous.

But  $f^{-1}(p) = \{b, c\}$  and  $f^{-1}(q) = \{a\}$  are not closed in  $(X, \tau_1, \tau_2)$ .

Therefore  $f$  is not continuous.

**Proposition 3.5:** If  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  is  $\tau_j$ - $\sigma_k$  continuous, then it is  $(i, j)$ - $g^\#$  continuous.

**Proof:** Let  $V$  be a closed set in  $(Y, \sigma_1, \sigma_2)$

Let  $V$  be  $\sigma_k$ -closed. Then  $f^{-1}(V)$  is  $\tau_j$ -closed and every  $\tau_j$ -closed set is  $(i, j)$ - $g^\#$  closed.

Therefore  $f^{-1}(V)$  is  $(i, j)$ - $g^\#$  closed.

Hence  $f$  is  $(i, j)$ - $g^\#$  continuous.

**Remark 3.6:** Converse of the above proposition is not true as seen from the following example.

**Example 3.7:** Let  $X = Y = \{a, b, c\}$

$\tau_1 = \{\emptyset, X, \{b\}\}, \tau_2 = \{\emptyset, X, \{c\}\}$  and

$\sigma_1 = \{\emptyset, Y, \{a\}\}, \sigma_2 = \{\emptyset, Y, \{b\}, \{c\}\}$

Define a mapping  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  by

$f(a) = f(b) = c; f(c) = a$

$f^{-1}(c) = \{a, b\}$  and  $f^{-1}(a) = c$  are  $(i, j)$ - $g^\#$  closed in  $(X, \tau_1, \tau_2)$

Hence  $f$  is a  $(i, j)$ - $g^\#$  continuous map

$\{c\} \in \sigma_2$  but  $f^{-1}(c) = \{a, b\}$  is not a  $\tau_2$  closed.

Therefore  $f$  is not  $\tau_2$ - $\sigma_2$  continuous.

**Proposition 3.8:** Every  $(i, j)$ - $g$ -continuous map is  $(i, j)$ - $g^\#$  continuous.

**Proof:** Let  $V$  be a closed set in  $(Y, \sigma_1, \sigma_2)$

Then  $f^{-1}(V)$  is  $(i, j)$ - $g$ -closed and every  $(i, j)$ - $g$ -closed set is  $(i, j)$ - $g^\#$  closed.

Therefore  $f^{-1}(V)$  is  $(i, j)$ - $g^\#$  closed.

Hence  $f$  is  $(i, j)$ - $g^\#$  continuous.

**Proposition 3.9:** Every  $(i, j)$ - $g^\#$  continuous map is  $(i, j)$ - $gpr$  continuous.

**Proof:** Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  be a  $(i, j)$ - $g^\#$  continuous map.

To prove :  $f$  is  $(i, j)$ - $gpr$  continuous.

Let  $V$  be a closed set in  $(Y, \sigma_1, \sigma_2)$ .

Since  $f$  is  $(i, j)$ - $g^\#$  continuous,  $f^{-1}(V)$  is  $(i, j)$ - $g^\#$  closed in  $(X, \tau_1, \tau_2)$ .

$f^{-1}(V)$  is  $(i, j)$ - $gpr$  closed.

Hence  $f$  is  $(i, j)$ - $gpr$  continuous.

**Remark 3.10:** Converse of the above proposition is not true as seen from the following example.

**Example 3.11:** Let  $X = Y = \{a, b, c\}$

$\tau_1 = \{\emptyset, X, \{b\}, \{a, b\}\}, \tau_2 = \{\emptyset, X, \{a, c\}\}$  and

$\sigma_1 = \{\emptyset, Y, \{b, c\}\}, \sigma_2 = \{\emptyset, Y, \{a, b\}\}$

Define a mapping  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  by

$f(a) = f(b) = c; f(c) = a$

$f^{-1}(c) = \{a, b\}$  and  $f^{-1}(a) = c$  are  $(i, j)$ - $gpr$  closed set in  $(X, \tau_1, \tau_2)$

Hence  $f$  is a  $(i, j)$ - $gpr$  continuous map.

$f^{-1}(c)=\{a, b\}$  is not a  $(i, j)$ - $g^{##}$  closed.  
Therefore  $f$  is not  $(i, j)$ - $g^{##}$  continuous.  
Hence  $f$  is  $(i, j)$ - $gpr$  continuous but not  $(i, j)$ - $g^{##}$  continuous.

**Proposition 3.12:** Every  $(i, j)$ - $((g^*p)^*)$  continuous map is  $(i, j)$ - $g^{##}$  continuous.

**Proof:** Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  be a  $(i, j)$ - $((g^*p)^*)$  continuous map.

To prove:  $f$  is  $(i, j)$ - $g^{##}$  continuous.

Let  $V$  be closed set in  $(Y, \sigma_1, \sigma_2)$ .

Since  $f$  is  $(i, j)$ - $((g^*p)^*)$  continuous,  $f^{-1}(V)$  is  $(i, j)$ - $((g^*p)^*)$  closed in  $(X, \tau_1, \tau_2)$ .

Since Every  $(i, j)$ - $((g^*p)^*)$  closed set is  $(i, j)$ - $g^{##}$  closed.

So  $f^{-1}(V)$  is  $(i, j)$ - $g^{##}$  closed.

Hence  $f$  is  $(i, j)$ - $g^{##}$  continuous.

**Remark 3.13:** Converse of the above proposition is not true as seen from the following example.

**Example 3.14:** Let  $X=\{a, b, c\}$ ,  $\tau_1=\{\varphi, X, \{a\}\}$ ,  $\tau_2=\{\varphi, X, \{a\}, \{a, b\}\}$  and  $Y=\{p, q\}$

$\sigma_1=\{\varphi, Y, \{p\}\}$ ,  $\sigma_2=\{\varphi, Y, \{q\}\}$

Define a mapping  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  by  $f(a)=f(c)=p; f(b)=q$

To prove:  $f$  is  $(i, j)$ - $g^{##}$  continuous but not  $(i, j)$ - $((g^*p)^*)$  continuous.

$f^{-1}(p)=\{a, c\}$  and  $f^{-1}(q)=b$  are  $(i, j)$ - $g^{##}$  closed set in  $(X, \tau_1, \tau_2)$  but not  $(i, j)$ - $((g^*p)^*)$  closed in  $(X, \tau_1, \tau_2)$ .

Hence  $f$  is  $(i, j)$ - $g^{##}$  continuous but not  $(i, j)$ - $((g^*p)^*)$  continuous.

**Proposition 3.15:** Every  $(i, j)$ - $g^*$  continuous map is  $(i, j)$ - $g^{##}$  continuous.

**Proof :** Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  be  $(i, j)$ - $g^*$  continuous.

Let  $V$  be a closed set in  $(Y, \sigma_1, \sigma_2)$ .

Let us prove that  $f^{-1}(V)$  is  $(i, j)$ - $g^{##}$  closed in  $(X, \tau_1, \tau_2)$ .

Since  $f$  is  $(i, j)$ - $g^*$  continuous,  $f^{-1}(V)$  is  $(i, j)$ - $g^*$  closed.

$f^{-1}(V)$  is  $(i, j)$ - $g^{##}$  closed, since Every  $(i, j)$ - $g^*$  closed set is  $(i, j)$ - $g^{##}$  closed.

Therefore  $f$  is  $(i, j)$ - $g^{##}$  continuous.

**Remark 3.16:** Converse of the above proposition is not true as seen from the following example:

**Example 3.17:** Let  $X=Y=\{a, b, c\}$ ,  $\tau_1=\{\varphi, X, \{b\}\}$ ,  $\tau_2=\{\varphi, X, \{c\}\}$  and  $\sigma_1=\{\varphi, Y, \{b, c\}\}$ ,  $\sigma_2=\{\varphi, Y, \{a\}\}$

Define  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  by  $f(a)=\{b, c\}, f(b)=f(c)=\{a\}$

$f^{-1}\{b, c\}=\{a\}$  and  $f^{-1}\{a\}=\{b, c\}$

$f^{-1}\{a\}=\{b, c\}$  and  $f^{-1}\{b, c\}=\{a\}$  are  $(i, j)$ - $g^{##}$  closed sets in  $(X, \tau_1, \tau_2)$

Hence  $f$  is  $(i, j)$ - $g^{##}$  continuous map.

$f^{-1}\{a\}=\{b, c\}$  and  $f^{-1}\{b, c\}=\{a\}$  are not a  $(i, j)$ - $g^*$  closed set.

Therefore  $f$  is not  $(i, j)$ - $g^*$  continuous map.

Hence  $f$  is  $(i, j)$ - $g^{##}$  continuous but not  $(i, j)$ - $g^*$  continuous.

**Proposition 3.18:** Every  $(i, j)$ - $g^{##}$  continuous map  $(i, j)$ - $wg$  continuous.

**Proof :** Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  be  $(i, j)$ - $g^{##}$  continuous.

Let  $V$  be a closed set in  $(Y, \sigma_1, \sigma_2)$ .

Let us prove that  $f^{-1}(V)$  is  $(i, j)$ - $wg$  closed in  $(X, \tau_1, \tau_2)$ .

Since  $f$  is  $(i, j)$ - $g^{##}$  continuous,  $f^{-1}(V)$  is  $(i, j)$ - $g^{##}$  closed.

Since every  $(i, j)$ - $g^{##}$  closed is  $(i, j)$ - $wg$  closed,  $f^{-1}(V)$  is  $(i, j)$ - $wg$  closed.

Therefore  $f$  is  $(i, j)$ - $wg$  continuous.

**Remark 3.19:** The converse of the above proposition is not true as seen from the following example:

**Example 3.20:**

Let  $X=Y=\{a, b, c\}$ ,  $\tau_1=\{\varphi, X, \{a\}, \{a, c\}\}$ ,  $\tau_2=\{\varphi, X, \{a\}\}$  and  $\sigma_1=\{\varphi, Y, \{a, c\}\}$ ,  $\sigma_2=\{\varphi, Y, \{c\}\}$

Define  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  by  $f(c)=\{b\}$ ,  $f(a)=f(b)=\{c\}$

$f^{-1}\{b\}=\{c\}$  and  $f^{-1}\{c\}=\{a, b\}$  are  $(i, j)$ - $wg$  closed sets in  $(X, \tau_1, \tau_2)$

Hence  $f$  is  $(i, j)$ - $wg$  continuous map.

$f^{-1}\{b\}=\{c\}$  is not  $(i, j)$ - $g^{##}$  closed sets in  $(X, \tau_1, \tau_2)$ .

Therefore  $f$  is not  $(i, j)$ - $g^{##}$  continuous.

Hence  $f$  is  $(i, j)$ - $wg$  continuous but not  $(i, j)$ - $g^{##}$  continuous.

**Proposition 3.21:** Every  $(i, j)$ - $g^{##}$ -continuous map is  $(i, j)$ - $rg$  continuous.

**Proof:** Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  be a  $(i, j)$ - $g^{##}$ -continuous map.

Let us prove that  $f$  is  $(i, j)$ - $rg$  continuous

Let  $V$  be a closed set in  $(Y, \sigma_1, \sigma_2)$

Since  $f$  is  $(i, j)$ - $g^{##}$ -continuous,  $f^{-1}(V)$  is  $(i, j)$ - $g^{##}$ -closed.

Every  $(i, j)$ - $rg$ -closed set is  $(i, j)$ - $g^{##}$  closed.

Therefore  $f^{-1}(V)$  is  $(i, j)$ - $rg$  closed.

Hence  $f$  is  $(i, j)$ - $rg$  continuous.

**Proposition 3.22:** Every  $(i, j)$ - $g^{##}$  continuous map  $(i, j)$ - $gsp$  continuous.

**Proof:** Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  be  $(i, j)$ - $g^{##}$  continuous.

Let  $V$  be a closed set in  $(Y, \sigma_1, \sigma_2)$ .

Let us prove that  $f^{-1}(V)$  is  $(i, j)$ - $gsp$  closed in  $(X, \tau_1, \tau_2)$ .

Since  $f$  is  $(i, j)$ - $g^{##}$  continuous,  $f^{-1}(V)$  is  $(i, j)$ - $g^{##}$  closed.

$f^{-1}(V)$  is  $(i, j)$ - $gsp$  closed, since every  $(i, j)$ - $g^{##}$  closed is  $(i, j)$ - $gsp$  closed.

Therefore  $f$  is  $(i, j)$ - $gsp$  continuous.

**Remark 3.23:** The converse of the above proposition is not true as seen from the following example:

**Example 3.24:**

Let  $X = Y = \{a, b, c\}$ ,  $\tau_1=\{\varphi, X, \{b\}, \{a, b\}\}$ ,  $\tau_2=\{\varphi, X, \{a, c\}\}$  and  $\sigma_1=\{\varphi, Y, \{a, b\}\}$ ,  $\sigma_2=\{\varphi, Y, \{c\}\}$

Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  the identity map.

Let us prove that  $f$  is  $(i, j)$ - $gsp$  continuous but not  $(i, j)$ - $g^{##}$  continuous.

$f^{-1}(c) = \{c\}$  and  $f^{-1}(a, b) = \{a, b\}$  is  $(i, j)$ - $gsp$  closed in  $(X, \tau_1, \tau_2)$ .

Hence  $f$  is  $(i, j)$ - $gsp$  continuous.

$f^{-1}(a, b) = \{a, b\}$  is not  $(i, j)$ - $g^{##}$  closed in  $(X, \tau_1, \tau_2)$

Therefore  $f$  is not  $(i, j)$ - $g^{##}$  continuous.

Hence  $f$  is  $(i, j)$ - $gsp$  continuous but not  $(i, j)$ - $g^{##}$  continuous.

**Proposition 3.25:** Every  $(i, j)$ - $g^{##}$  continuous map  $(i, j)$ - $\alpha g$  continuous.

**Proof:** : Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  be  $(i, j)$ - $g^{##}$  continuous.

Let  $V$  be a closed set in  $(Y, \sigma_1, \sigma_2)$ .

Let us prove that  $f^{-1}(V)$  is  $(i, j)$ - $\alpha g$  closed in  $(X, \tau_1, \tau_2)$ .

Since  $f$  is  $(i, j)$ - $g^{##}$  continuous,  $f^{-1}(V)$  is  $(i, j)$ - $g^{##}$  closed.

Since  $f^{-1}(V)$  is  $(i, j)$ - $\alpha g$  closed.

Therefore  $f$  is  $(i, j)$ - $\alpha g$  continuous.

**Remark 3.26:** The converse of the above proposition is not true as seen from the following example.

**Example 3.27:**

Let

$$X = Y =$$

$$\{a, b, c\}, \tau_1 = \{\varphi, X, \{a\}, \{b, c\}\}, \tau_2 =$$

$$\{\varphi, X, \{a\}, \{b\}, \{a, b\}, \{a, c\}\} \quad \text{and}$$

$$\sigma_1 = \{\varphi, Y, \{b, c\}\}, \sigma_2 = \{\varphi, Y, \{a\}\}$$

Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  the identity map.

Let us prove that  $f$  is  $(i, j)$ - $\alpha g$  continuous but not  $(i, j)$ - $g^{##}$  continuous.

$f^{-1}(a) = \{a\}$  and  $f^{-1}(b, c) = \{b, c\}$  is  $(i, j)$ - $\alpha g$  closed sets in  $(X, \tau_1, \tau_2)$ .

Hence  $f$  is  $(i, j)$ - $\alpha g$  continuous.

$f^{-1}(a) = \{a\}$  is not  $(i, j)$ - $g^{##}$  closed in  $(X, \tau_1, \tau_2)$ .

Therefore  $f$  is not  $(i, j)$ - $g^{##}$  continuous.

Hence  $f$  is  $(i, j)$ - $\alpha g$  continuous but not  $(i, j)$ - $g^{##}$  continuous.

**Proposition 3.28:** Every  $(i, j)$ - $g^{##}$ -continuous map  $(i, j)$ - $g^{**}$  continuous.

**Proof:** Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  be a  $(i, j)$ - $g^{##}$ -continuous map.

Let us prove that  $f$  is  $(i, j)$ - $g^{**}$  continuous

Let  $V$  be a closed set in  $(Y, \sigma_1, \sigma_2)$

Since  $f$  is  $(i, j)$ - $g^{##}$ -continuous,  $f^{-1}(V)$  is  $(i, j)$ - $g^{##}$ -closed.

Every  $(i, j)$ - $g^{##}$ -closed set is  $(i, j)$ - $g^{**}$  closed.

Therefore  $f^{-1}(V)$  is  $(i, j)$ - $g^{**}$  closed.

Hence  $f$  is  $(i, j)$ - $g^{**}$  continuous.

**Proposition 3.29:** Every  $(i, j)$ - $g^{##}$  continuous map  $(i, j)$ - $gs$  continuous.

**Proof:** Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  be  $(i, j)$ - $g^{##}$  continuous.

Let  $V$  be a closed set in  $(Y, \sigma_1, \sigma_2)$ .

Let us prove that  $f^{-1}(V)$  is  $(i, j)$ - $gs$  closed in  $(X, \tau_1, \tau_2)$ .

Since  $f$  is  $(i, j)$ - $g^{##}$  continuous,  $f^{-1}(V)$  is  $(i, j)$ - $g^{##}$  closed.

$f^{-1}(V)$  is  $(i, j)$ - $gs$  closed.

Therefore  $f$  is  $(i, j)$ - $gs$  continuous.

**Remark 3.30:** The converse of the above proposition is not true as seen from the following example:

**Example 3.31:**

Let

$$X =$$

$$Y\{a, b, c\}, \tau_1 = \{\varphi, X, \{a\}, \{a, b\}\}, \tau_2 = \{\varphi, X, \{a\}, \{b\}, \{a, b\}\} \text{ and}$$

$$\sigma_1 = \{\varphi, Y, \{a, c\}\}, \sigma_2 = \{\varphi, Y, \{b, c\}\}$$

Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  be the identity map.

To prove:  $f$  is  $(i, j)$ - $gs$  continuous but not  $(i, j)$ - $g^{##}$  continuous.

$f^{-1}(a) = \{a\}$  and  $f^{-1}(b) = \{b\}$  is  $(i, j)$ - $gs$  closed sets in  $(X, \tau_1, \tau_2)$ .

Hence  $f$  is  $(i, j)$ - $gs$  continuous.

$f^{-1}(a) = \{a\}$  and  $f^{-1}(b) = \{b\}$  is not  $(i, j)$ - $g^{##}$  closed in  $(X, \tau_1, \tau_2)$ .

Therefore  $f$  is not  $(i, j)$ - $g^{##}$  continuous.

Hence  $f$  is  $(i, j)$ - $gs$  continuous but not  $(i, j)$ - $g^{##}$  continuous.

**Proposition 3.32:** Every  $(i, j)$ - $g^{##}$  continuous map is  $(i, j)$ - $g^{##}$  continuous.

**Proof:** Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  be  $(i, j)$ - $g^{##}$  continuous.

Let  $V$  be a closed set in  $(Y, \sigma_1, \sigma_2)$ .

Let us prove that  $f^{-1}(V)$  is  $(i, j)$ - $g^{##}$  closed in  $(X, \tau_1, \tau_2)$ .

Since  $f$  is  $(i, j)$ - $g^{##}$  continuous,  $f^{-1}(V)$  is  $(i, j)$ - $g^{##}$  closed.

Therefore  $f$  is  $(i, j)$ - $g^{##}$  continuous.

**Remark 3.33:** The converse of the above proposition is not true as seen from the following example:

**Example 3.34:** Let  $X = \{a, b, c\}$

$$, \tau_1 = \{\varphi, X, \{b\}\}, \tau_2 = \{\varphi, X, \{a, c\}\} \text{ and } Y = \{p, q\}$$

$$\sigma_1 = \{\varphi, Y, \{p\}\}, \sigma_2 = \{\varphi, Y, \{q\}\}$$

Define a mapping  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  by

$$f(b) = f(c) = p; f(a) = q$$

$f^{-1}(p) = \{b, c\}$  and  $f^{-1}(q) = \{a\}$  are  $(i, j)$ - $g^{##}$  closed set in  $(X, \tau_1, \tau_2)$  but not  $(i, j)$ - $g^{##}$  closed in  $(X, \tau_1, \tau_2)$

Hence  $f$  is  $(i, j)$ - $g^{##}$  continuous but not  $(i, j)$ - $g^{##}$  continuous.

**Proposition 3.35:** Let  $f: (X, \tau_1, \tau_2) \rightarrow (Y, \sigma_1, \sigma_2)$  and  $g: (Y, \sigma_1, \sigma_2) \rightarrow (Z, \eta_1, \eta_2)$  be two maps. Then  $(g \circ f)$  is  $(i, j)$ - $g^{##}$  continuous if  $g$  is continuous and  $f$  is  $(i, j)$ - $g^{##}$  continuous.

**Proof:** Let  $V$  be closed set in  $(Z, \eta_1, \eta_2)$ .

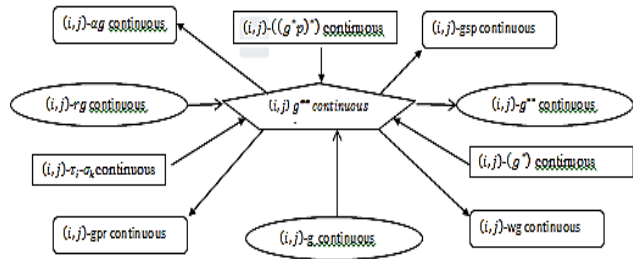

Let us prove that  $(g \circ f)^{-1}(V)$  is  $(i, j)$ - $g^{##}$  closed in  $(Y, \sigma_1, \sigma_2)$ .

Since  $g$  is continuous,  $g^{-1}(V)$  is closed in  $(Y, \sigma_1, \sigma_2)$ .

Since  $f$  is  $(i, j)$ - $g^{##}$  continuous,  $f^{-1}(g^{-1}(V))$  is  $(i, j)$ - $g^{##}$  closed in  $(X, \tau_1, \tau_2)$ .

Therefore  $(g \circ f)^{-1}(V)$  is  $(i, j)$ - $g^{##}$  closed in  $(X, \tau_1, \tau_2)$ .

Therefore  $(g \circ f)$  is  $(i, j)$ - $g^{##}$  continuous  
 The above results can be represented in the following figure:
